

Assignment 6 – User Interface

I. Chosen User Interface and Justification

Chosen UI Type

Web-based chatbot interface (Natural language interface with graphical UI)

Our system uses a **chat-style web interface** where users type questions about their Steam gaming statistics.

Justification

- Users can ask questions in **simple natural language** (e.g., “How many hours have I played CS2?”).
- The chat interface makes it easy to access information without navigating multiple menus.
- The UI is simple and intuitive, with an input field and a chat display.
- It allows users to quickly request different types of information such as playtime, recently played games, and recommendations.
- New features can be added easily by supporting new queries without redesigning the interface.
- Web versions are widely available.
- Web versions are lightweight compared to other models.

This type of interface is suitable for the project because the goal of the system is to **make Steam statistics easier to access through conversation**.

II. UI Implementation and User Interaction

Implemented UI Components

The following UI components are implemented:

- **Chat input field** – where the user types queries.
 - **Send button** – sends the query to the backend.
 - **Chat display area** – shows the conversation between the user and the system.
 - **Response display** – shows statistics and results returned by the backend.
-

User Interaction Flow

1. The user opens the web application in a browser.
2. The user enters a query in the chat input field.
3. The frontend sends the query to the backend API.
4. The backend processes the query using Steam API data.
5. The response is returned to the frontend.
6. The result is displayed in the chat window.
